INTRODUCTION

Author

Samuele Carcagno

Module for reading and writing WAV files using MATLAB-style wavread and wavwrite functions. It is a simple but convenient wrapper to the `scipy.io.wavfile` module.

WAVPY – MODULE TO READ AND WRITE WAVS

Module for reading and writing WAV files. It is a simple but convenient wrapper to the wave module and the scipy.io.wavfile module.

`wavpy.sound(snd, fs=48000, nbits=32)`

Play out a numpy array through the soundcard.

2.1 Parameters

snd

[array of floats] The sound to be played.

fs

[int] Sampling frequency of the sound.

nbits

[int] Desired bit depth.

2.2 Examples

```
>>> sound(snd, fs=48000, nbits=32)
```

`wavpy.wavread(fName, scale=True)`

Read a WAV file into a numpy array.

2.3 Parameters

fName

[string] Name of the WAV file to read

scale

[boolean] Option valid only for the PCM wave format. If *True* the data will be returned as floating point values ranging between -1 and 1. If *False* the data will be returned as the closest numpy integer type to the WAV bit depth, with values ranging within the bit depth range.

2.4 Returns

`snd` : numpy array with the sound.

`fs` : sampling frequency.

`nbits` : bit depth.

2.5 Examples

```
>>> snd, fs, nbits = wavread("file.wav")
```

`wavpy.wavwrite(data, fs, nbits, fName, wave_format='PCM', scale=True)`

Write a numpy array as a WAV file.

2.6 Parameters

data

[array of floats] The data to be written to the WAV file.

fs

[int] Sampling frequency of the sound.

nbits

[int] Bit depth of the WAV file (currently only values of 16 and 32 are supported)

fName

[string] Name of the WAV file.

scale

[boolean] Option valid only for the PCM wave format. If the data are floating point values ranging from -1 to 1 and scale is set to *True* they will be converted to the range of the appropriate integer type (according to the chosen bit depth). If scale is set to *False* it is assumed that the values are already in the range of the appropriate integer type (e.g. between -2^{15} and $2^{15}-1$ for 16 bits). Note that if *wave_format* is set to *IEEE_FLOAT* the data are never scaled.

2.7 Examples

```
>>> wavwrite(data, 48000, 32, "file.wav")
```

INDICES AND TABLES

- `genindex`
- `modindex`
- `search`
